

CLASS NOTES-ANSWERS

EXERCISE 3.3

1. Given a parallelogram ABCD. Complete each statement along with the definition or property used.

(i) $AD = \dots\dots$

(ii) $\angle DCB = \dots\dots$

(iii) $OC = \dots\dots$

(iv) $m\angle DAB + m\angle CDA = \dots\dots$

Answer:

(i) The opposite sides of a parallelogram are of equal length.

$$AD = BC$$

(ii) In a parallelogram, opposite angles are equal in measure.

$$\angle DCB = \angle DAB$$

(iii) In a parallelogram, diagonals bisect each other. Hence,

$$OC = OA$$

(iv) In a parallelogram, adjacent angles are supplementary to each other.

$$m\angle DAB + m\angle CDA = 180^\circ$$

2. Consider the following parallelograms. Find the values of the unknowns x, y, z.

(i)

(ii)

(iii)

(iv)

(v)

Answer:

(i) $y = 100^\circ$ [Since opposite angles of a parallelogram are equal]

$\angle C + \angle B = 180^\circ$ (The adjacent angles in a parallelogram are supplementary)

$x + 100^\circ = 180^\circ$ (The adjacent angles in a parallelogram are supplementary)

$x = 180^\circ - 100^\circ = 80^\circ$

$x = z = 80^\circ$ [Since opposite angles of a parallelogram are equal]

(ii) $x + 50^\circ = 180^\circ$ (The adjacent angles in a parallelogram are supplementary)

$x = 180^\circ - 50^\circ = 130^\circ$

$x = y = 130^\circ$ (Since opposite angles of a parallelogram are equal)

$x = z = 130^\circ$ (Corresponding angles)

(iii) $x + y + 30^\circ = 180^\circ$ (Angle sum property of triangles)

$x = 90^\circ$ (Vertically opposite angles)

$90^\circ + y + 30^\circ = 180^\circ$

$y + 120 = 180^\circ$

$$y = 60^\circ$$

$$z = y = 60^\circ \text{ (Alternate interior angles are equal)}$$

(iv) $z = 80^\circ$ (Corresponding angles)

$$y = 80^\circ \text{ (since opposite angles of a parallelogram are equal)}$$

$$x + y = 180^\circ \text{ (Adjacent angles are supplementary)}$$

$$x + 80^\circ = 180^\circ$$

$$x = 180^\circ - 80^\circ$$

$$x = 100^\circ$$

(v) $y = 112^\circ$ (Since opposite angles of a parallelogram are equal)

$$x + y + 40^\circ = 180^\circ \text{ (Angle sum property of triangles)}$$

$$x + 112^\circ + 40^\circ = 180^\circ$$

$$x + 152^\circ = 180^\circ$$

$$x = 180^\circ - 152^\circ$$

$$x = 28^\circ$$

$$z = x = 28^\circ \text{ (Alternate interior angles are equal)}$$

3. Can a quadrilateral ABCD be a parallelogram if

(i) $\angle D + \angle B = 180^\circ$?

(ii) $AB = DC = 8 \text{ cm}$, $AD = 4 \text{ cm}$ and $BC = 4.4 \text{ cm}$?

(iii) $\angle A = 70^\circ$ and $\angle C = 65^\circ$?

Answer:

(i) $\angle A + \angle B + \angle D + \angle C = 360^\circ$

$$\angle A + \angle C + 180^\circ = 360^\circ$$

$$\angle A + \angle C = 360^\circ - 180^\circ$$

$\angle A + \angle C = 180^\circ$ (Opposite angles should also be of same measures.)

For $\angle D + \angle B = 180^\circ$, is a parallelogram.

If the following conditions is fulfilled, then ABCD is a parallelogram. The sum of the measures of the adjacent angles should be 180° .

Opposite angles should also be of same measure.

(ii) Property of parallelogram: The opposite sides of a parallelogram are of equal length. Opposite sides AD and BC are of different lengths. So, it's not parallelogram.

(iii) Property: In a parallelogram opposite angles are equal.

So, $\angle A = 70^\circ$ and $\angle C = 65^\circ$ are not equal.

So ABCD is not parallelogram.

4. Draw a rough figure of a quadrilateral that is not a parallelogram but has exactly two opposite angles of equal measure

Answer:

In a kite, the angle between unequal sides are equal.

The quadrilateral ABCD is not a parallelogram as the measures of the remaining pair of opposite angles, $\angle A$ and $\angle C$, are not equal. Since they form angle between equal sides.

5. The measures of two adjacent angles of a parallelogram are in the ratio 3 : 2. Find the measure of each of the angles of the parallelogram.

Answer:

The sum of the measures of adjacent angles is 180° for a parallelogram.

$$\angle A + \angle B = 180^\circ$$

$$3x + 2x = 180^\circ$$

$$5x = 180^\circ$$

$$x = 36^\circ$$

$$\angle A = \angle C = 3x = 108^\circ \text{ (Opposite angles)}$$

$$\angle B = \angle D = 2x = 72^\circ \text{ (Opposite angles)}$$

Thus, the measures of the angles of the parallelogram are 108° , 72° , 108° , and 72° .

6. Two adjacent angles of a parallelogram have equal measure. Find the measure of each of the angles of the parallelogram.

Answer:

In parallelogram ABCD,

$\angle A$ and $\angle D$ are supplementary since DC is parallel to AB and with

transversal DA, making $\angle A$ and $\angle D$ interior opposite.

$\angle A$ and $\angle B$ are also supplementary since AD is parallel to BC and with transversal BA, making $\angle A$ and $\angle B$ interior opposite.

Sum of adjacent angles = 180°

Let each adjacent angle be x

Since the adjacent angles in a parallelogram are supplementary.

$$x + x = 180^\circ$$

$$2x = 180^\circ$$

$$x = 90^\circ$$

Hence, each adjacent angle is 90° .

$$\angle A = \angle B = 90^\circ \text{ (adjacent angles)}$$

$$\angle C = \angle A = 90^\circ \text{ (Opposite angles)}$$

$$\angle D = \angle B = 90^\circ \text{ (Opposite angles)}$$

Thus, each angle of the parallelogram measures 90° .

7. The adjacent figure HOPE is a parallelogram. Find the angle measures x , y and z . State the properties you use to find them.

Answer:

$$\angle HOP + 70^\circ = 180^\circ \text{ [Angles of linear pair]}$$

$$\angle HOP = 180^\circ - 70^\circ$$

$$\angle HOP = 110^\circ$$

$$\angle HOP = \angle E \text{ (opposite angles are equal)}$$

$$\therefore x = 110^\circ$$

$$y = 40^\circ \text{ (Alternate interior angles are equal)}$$

$$z + 40^\circ = 70^\circ \text{ (Corresponding angles)}$$

$$z = 70^\circ - 40^\circ$$

$$z = 30^\circ$$

8. The following figures GUNS and RUNS are parallelograms. Find x and y.

(Lengths are in cm)

Answer:

(i) In a parallelogram, the opposite sides have same length.

- $SG = NU$

$$3x = 18$$

$$x = 6$$

- $SN = GU$

$$26 = 3y - 1$$

$$3y = 26 + 1$$

$$y = 9$$

Hence, the measures of x and y are 6 cm and 9 cm respectively.

(ii) The diagonals of a parallelogram bisect each other.

- $y + 7 = 20$

$$y = 20 - 7$$

$$y = 13$$

- $x + y = 16$

$$x + 13 = 16$$

$$x = 16 - 13$$

$$x = 3$$

Hence, the measures of x and y are 3 cm and 13 cm respectively.

9.

In the above figure both RISK and CLUE are parallelograms. Find the value of x .

Answer:

In parallelogram RISK,

$$\angle RKS + \angle ISK = 180^\circ \text{ [pair of adjacent angles are supplementary]}$$

$$120^\circ + \angle ISK = 180^\circ$$

$$\angle ISK = 180^\circ - 120^\circ$$

$$\angle ISK = 60^\circ$$

$$\angle RIS = \angle K = 120^\circ \text{ (In parallelogram opposite angles are equal)}$$

In parallelogram CLUE,

$$\angle L = \angle CEU = 70^\circ \text{ (In parallelogram opposite angles are equal)}$$

The sum of the measures of all the interior angles of a triangle is 180° .

$$x + 60^\circ + 70^\circ = 180^\circ$$

$$x + 130^\circ = 180^\circ$$

$$x = 180^\circ - 130^\circ$$

$$x = 50^\circ$$

10. Explain how this figure is a trapezium. Which of its two sides are parallel?

(Fig 3.32)

Fig 3.32

Answer:

In the given figure KLMN,

$$\angle L + \angle M = 180^\circ \text{ [two pair of adjacent angles are supplementary]}$$

$$80^\circ + 100^\circ = 180^\circ$$

Therefore, MN is parallel to KL

Hence, KLMN is a trapezium as it has a pair of parallel sides KL and MN.

11. Find $m\angle C$ in Fig 3.33 if $AB \parallel DC$.

Fig 3.33

Answer:

Given figure ABCD is a Trapezium, in which AB is parallel to DC.

$$\angle B + \angle C = 180^\circ \text{ [pair of adjacent angles are supplementary]}$$

$$120^\circ + \angle C = 180^\circ$$

$$\angle C = 180^\circ - 120^\circ$$

$$\angle C = 60^\circ$$

Therefore, $m\angle C = 60^\circ$

12. Find the measure of $\angle P$ and $\angle S$ if $SP \parallel RQ$ in Fig 3.34. (If you find $m\angle R$, is there more than one method to find $m\angle P$?)

Fig 3.34

Answer:

Given SP is parallel to RQ and SR is the transversal drawn to these lines.

Hence,

$$\angle S + \angle R = 180^\circ$$

$$\angle S + 90^\circ = 180^\circ$$

$$\angle S = 180^\circ - 90^\circ$$

$$\angle S = 90^\circ$$

Using the angle sum property of a quadrilateral,

$$\angle S + \angle P + \angle Q + \angle R = 360^\circ$$

$$90^\circ + \angle P + 130^\circ + 90^\circ = 360^\circ$$

$$\angle P + 310^\circ = 360^\circ$$

$$\angle P = 360^\circ - 310^\circ$$

$$\angle P = 50^\circ$$

Alternate Method:

$$\angle P + \angle Q = 180^\circ \text{ (adjacent angles)}$$

$$\angle P + 130^\circ = 180^\circ$$

$$\angle P = 180^\circ - 130^\circ$$

$$\angle P = 50^\circ$$

$$\angle S + \angle R = 180^\circ \text{ (adjacent angles)}$$

$$\angle S + 90^\circ = 180^\circ$$

$$\angle S = 180^\circ - 90^\circ$$

$$\angle S = 90^\circ$$
